RETRACTOR ADAMS-YOZU

HIGHLIGHT

Mini Retractor System

The rail is set at an angle, so that the head-side blade moves upward with opening. This allows surgeons to get great view around the aortic root.
This also helps to create wider working space for aortic cross clamping, route cannula insertion, de-airing and hemostasis, etc.

- Similar operability for conventional midline incisions can be applicable.
  Benefit: Shifting to Minimally Invasive Surgery can be performed easily.
- Good operative fields and operability are ensured under direct-vision, endoscopic-assisted, or endoscopic surgeries
- Since depressor blades (29-0937.XX) are inserted through the incision, arrangement, positioning and exchanging of blades can be performed quickly, safely and easily.
- Benefit: Eliminates risks, such as damages to the internal thoracic artery branches which may occur by using the conventional retractors, which are assembled inside the chest after puncturing the chest wall.
