ValveGate™ represents a groundbreaking advancement in minimally invasive surgery (MIS) instruments, designed to enhance precision, efficiency, and patient outcomes.

The name itself encapsulates its innovative design and functionality: **Valve** refers to the retractor's blades or valves, which are engineered to provide optimal access and visibility during surgical procedures. These blades can be adjusted to create a stable and controlled working space within the body, ensuring surgeons can operate with confidence and accuracy.

Gate symbolizes the access door created by the retractor. This "gate" allows surgical instruments to be introduced through a small incision, minimizing tissue disruption and reducing trauma to the patient. The design ensures seamless entry and exit of tools while maintaining a secure and sterile environment.

During a procedure, a small incision is made, and the ValveGate™ retractor is inserted. The blades are then carefully adjusted to create a controlled access point, or "gate," through which these instruments can be introduced. The retractor maintains the opening while protecting surrounding tissues, allowing surgeons to perform complex tasks with minimal disruption.

Iron Assistant™ Pneumatic Holder

for direct connection with the compressed air supply in the OR (working pressure 5 bar up to 7 bar). Enables instantaneous and unlimited one-hand manipulation of an endoscope or tube shaft instrument within the operation fild followed by total steadiness and stability under load once in the "locked" position. Easy handling and highest reliability due to the one-hand concept with only 3 hinges and the use of titanium components for weight reduction.

The pneumatic arm can be easily attached to the OR table rail and is autoclavable completely or partially (if draping is preferred) for quick sterile set-up.

ValveGate™

LapProtector™ for ValveGate™

The LapProtector™ for Minimally Invasive Surgery is a sterile, single patient use wall access device consisting of 2 overlaid plastic rings that are interconnected by means of a silicone rubber membrane. The bottom ring is a flexible ring made with a shape memory alloy to be inserted in situ.

The special features are:
- protects wound edge and surrounding tissue
- usable with or without retractor
- can be used in combination with incision foil
- reduces risk of embolic fat particles on instruments, sutures and knot pushers
- improves visibility and exposure
- self-holding, for incisions from 6 cm to 9 cm (regular size) and from 3 cm to 5 cm (small size)
- very easy to insert in situ
- high flexibility
- latex-free silicone rubber

sterile, single use, latex-free, pack of 2 pcs.

Art.-No.	Type	Description	
29-1399	FF1210H strong	regular size,	OD 120 x 100 mm, ID 60 mm, 30 mm depth
29-1399S	FF0707L	smal size,	OD 70 x 70 mm, ID 35 mm, 40 mm depth
29-1399M	FF1010H	medium,	OD 100 x 100 mm, ID 60 mm, 40 mm depth

For easy placement simply push the flexible ring downwards as illustrated and insert it into the wound cavity. Then push the reversed portion carefully down as well and expand it. Remove it in the opposite way by inserting some fingers, grabbing a part of the flexible ring, and pulling it out carefully. Dispose after use.
